Biotechnology

At Voryst, we have developed extensive capabilities to assist clients in the biotechnology industry, including any company that is involved in biotechnology, drug development and manufacturing, diagnostics, genomics, medical devices, bioinformatics, proteomics, vaccines, screening assays and methods or therapeutics. We believe in a proactive approach to help our clients grow by taking products from the laboratory to the marketplace. We provide counsel and assistance in areas such as licensing and strategic collaborations; intellectual property; patent prosecution; protection of trade secrets; mergers and acquisitions; employment; risk management and litigation. Our lawyers are active members of the life sciences community, through bar associations, trade associations and industry organizations. Our experience in the industry brings a rapid understanding of how an intellectual property strategy can be structured to support an overall business strategy.
